The pre-registered hypotheses
H1 Genetics for the disease vs none, outside oncology
H2 Same target: diseases its genetics points to vs its other diseases
H3 Genetics and drug point the same way (per step)
H4 Genetics' effect on missed endpoints, per step from proximal to distal
H5 Genetics lowers efficacy failure more than business failure
H6 Safety risk of the target raises safety failure, outside oncology
H7 Oncology: mutation in the cancer matching the drug

Added by the plan amendment before outcomes were seen: US-developed programs, Holm-corrected across the three
N1 Small molecules: at least 10-fold selective
N2 Small molecules: drug-like (at most one Rule-of-5 violation)
N2 Neurology and psychiatry: brain-penetrant properties
N3 Outside oncology: potent (100 nM), genetics and drug-likeness held fixed
