Stopped for efficacy or exposure
Stopped for safety
◀ fewer stops
more stops ▶
Human genetics
Earlier drugs on the same target
Mouse genetics shows the disease
Tumour genetics
Curated pathway
Published study of the drug engaging its target in people
Published animal studies of the drug
Drug binding measured
RNA change in diseased tissue
Safety signals
Standard flags: gene intolerant to loss in people, or knockout mice die young
Mutant mice show a vital-organ phenotype
An earlier drug on the target stopped for safety
Drug binds another protein within 10-fold
