Why an engaged target still failed: the 27 atlas classes whose engagement held and whose efficacy was contradicted

Target hypothesis 16 · Modulation 6 · Trial 4 · Unclear 1 Rows 1–3 are Melissa's three reasons: 14 of 27 classes. Rows marked + are the additions: 13.

Target hypothesis: the target, with the sign of the intended effect (target selection)

1	Output moved, disease did not: not causal (12)	11β-HSD1 inh. · T2D; HCAR2 agon. · lipids; H3 antag. · AD; 5-HT6 antag. · AD; anti-IL-33 · eczema; p38 inh. · COPD; HDAC inh. · MDS; anti-IGF-1R · NSCLC; PDE10A inh. · schizophr.; GPR119 agon. · T2D; anti-IL-13 · asthma; MEK inh. · pancreatic
2	Causal, but at another disease stage (2)	BACE1 inh. · AD; CDK4/6 inh. · breast
3	Causal only in a subgroup (0)	*none of the 27*
+	Causal but compensated or bypassed (1)	new anti-EGFR · CRC
+	Causal, effect too small to matter (1)	pan-PI3K inh. · breast

Modulation: the drug, its dose or where it acted, not the target

+	Engagement not deep or long enough (6)	BTK inh. · RA; new NRTIs · HIV; HSP90 inh. · breast; PI3K/mTOR inh. · breast; anti-GM-CSF · RA; proteasome inh. · myeloma

Trial: the test, not the target or the drug

+	Population or placebo response (3)	allergen peptides · allergy; allergen IT · rhinitis; anti-CGRP · migraine
+	Combination or comparator context (1)	DP2 antag. · asthma

Unclear from the record

+	Unclear from the record (1)	DP2 antag. · rhinitis

filled: class never approved in this disease hollow: class approved; the contradiction is a stage, a population or one weak member

Every class here went into patients, so this is what a positive engagement result was worth, never a sensitivity. One primary reason per class, coded from the atlas's written reasons by two coders, the second blind to the first; statuses are the atlas's adjudicated statuses. Codes.csv lists each class with its secondary reason and rationale. Of the 60 dose tracks the atlas scored "reached the model's target, not enough", what had been reached was the regimen (20), the exposure (20), a PD biomarker (13) or receptor occupancy (7): exposure prediction held, the declared sufficient level did not.
